FLYNN, KIMBERLY D

ART UNIT	PAPER NUMBER
----------	--------------

2153

DATE MAILED: 09/23/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 09/520,853	Applicant(s) O'DOHERTY, MICHAEL	
	Examiner Kimberly D Flynn	Art Unit 2153	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
 - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
 - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
 - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 June 2004.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-33 is/are pending in the application.
- 4a) Of the above claim(s) 16-19 and 27-33 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 and 20-26 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

Detailed Action

1. This action is in response to an Amendment filed June 10, 2004. Claims 1-33 are pending in this application.

Claim Rejections – 35 U.S.C. 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1, 2, 5, 9, 10-15, and 20-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Venkatraman et al. (6,014,688), in view of Handley et al. (RFC 2543 – SIP: Session Initiation Protocol).

In considering claim 1 and 2, Venkatraman discloses an e-mail program capable of transmitting, opening and presenting a container having digital content using embedded executable software the system comprising:

storing the computer software in a message (col. 3, lines 66-67 through col. 4, lines 1-7)

sending the message and computer software code from the first client associated with the first node to the second client associated with the second node and executing the computer software using the second node (col. 4, lines 7-12).

Although the system taught Venkatraman shows substantial features of the claimed invention, it fails to specifically disclose the clients being SIP clients and the messages being of the SIP protocol. However, Handley et al., whose invention is the Internet standard for SIP, Session Initiation Protocol, discloses such nodes comprising an SIP client (see page 9, lines 17-19; page 11, lines 4-7), as well as an SIP message being sent from the client to the server, with the message associated with an option message body (see page 25, lines 21-33). Therefore, given the teachings of Handley et al., it would have been obvious for a person having ordinary skills in the art to modify Venkatraman to utilize the SIP protocol in order to extend the system features for use of various communications protocols such as SIP as well as utilizing software in conjunction with initializing multimedia sessions between the client and the server .

In considering claims 20 and 26, Venkatraman discloses a communications network node, as well as a communications network comprising a plurality of communications network nodes (see Fig. 1, and col. 3, lines 38-44), with each node comprising:

- a client (Fig. 1, (20);

- an input arranged to receive messages (Fig. 1, (30)); and

- a processor arranged to extract and execute computer software code from a received SIP message (see Fig. 1, (32) and col. 3, lines 50-51).

In considering claims 24 and 25, Venkatraman discloses a computer program, stored on a computer readable medium, arrange to control a communications network node, the node comprising a client(30) and a processor(32c), the computer program being arranged to control the node when executed on the processor such that when a message is received by the client,

Art Unit: 2153

which contains computer software code, the software code is executed by the processor (See Fig 1, col. 3, lines 50-55 and col. 4, lines 13-20).

Additionally, Handley et al. discloses an SIP client (see page 9, lines 17-19; page 11, lines 4-7), and an input arranged to receive SIP messages received by the SIP server (see page 25, lines 21-33); as well as the execution of software code within an SIP message when that message are received by SIP client (see page 20, lines 18-23).

In considering claims 2 and 10, Venkatraman further discloses a method wherein the computer software code is added to the message (see Venkatraman col. 4, lines 3-7).

In considering claim 5-6, Venkatraman discloses a method wherein the computer software code comprises Java byte code and one or more Java Applets (see col. 7, lines 6-16).

In considering claims 9 and 21, Venkatraman discloses a method wherein the second node comprises a Java virtual machine (see Venkatraman col. 7, lines 6-16).

In considering claims 11 and 23, Handley et al. discloses a method which further comprises adding an indicator to the header of the SDIP message in order to indicate the presence of the computer software code and arranging the second SIP client to recognize the indicator (content-type) (see page 85, lines 4-9).

In considering claim 12, Handley discloses a method which further comprises the step of proceeding with any SIP process related to the SIP message (via general header) (see page 25, lines 22-40; page 26, lines 1-11; page 27, Table 3).

In considering claim 13, although Venkatraman and Handley show substantial features of the claimed invention, they fail to a to specifically disclose a method wherein the second SIP client is arranged such that on receipt of a SIP message containing such an indicator, the

Art Unit: 2153

computer software code stored in the SIP message is executed by the second node before that second node carries out any other process related to the SIP message. Nonetheless, this execution of the computer software would have been an obvious modification to the SIP message containing an indicator for the message body/computer software in its header. It would have been obvious for a person having ordinary skills in the art to modify Venkatraman et al. and Handley et al. by employing a method wherein the second SIP client is arranged such that on receipt of a SIP message containing such an indicator, the computer software code associated with the SIP message is executed by the second node before that second node carries out any other process related to the SIP message in order to provide a level of priority for the message body/computer software over other SIP-specified processes, thus providing for the quick receipt of urgent computer software.

4. Claims 14, 15, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Venkatraman et al. and Handley et al. as applied to claim 1, and in further view of Gampper et al. (6,003,082).

In considering claims 14, 15, and 22, although the combined system of Venkatraman and Handley show substantial features of the claimed invention, they fail to disclose a method wherein the computer software being arranged to interact with the second SIP client via a specified API. However, Byttner et al. et al., whose invention is a proposal for a Java extension API for SIP servers, discloses such a specified API (see page 3, lines 15-20, lines 35-46). Therefore, given the teachings of Byttner et al., it would have been obvious for a person having ordinary skills in the art to modify Venkatraman et al. and Handley et al. by arranging computer

Art Unit: 2153

software to interact with the second SIP client via a specified API in order to the services needed to transport data across a network.

5. Claims 3 and 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Venkatraman and Handley as applied to claim 1, and in further view of Gampper et al. (6,003,082).

In considering claims 3 and 4, although Venkatraman et al. and Handley et al. show substantial features of the claimed invention, they fail to disclose a method wherein the step of associating computer software code with the SIP message comprises adding a URL to the SIP message which indicates where the computer software is stored. However, Gampper et al., whose invention is the use of a server to selectively filter and cache internet access requests from the terminals attached to the server, discloses such a URL, added to a message, that indicates where computer software code is stored (see col. 2, lines 32-43). Therefore, given the teachings of Gampper et al., it would have been obvious for a person having ordinary skills in the art to modify Venkatraman et al. and Handley et al. by adding a URL to the SIP message which indicates where the computer software is stored in order to reduce the byte overhead of the message body containing the computer software code.

6. Claims 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Venkatraman and Handley as applied to claim 1, and in further view of Lavian et al. (6,175,868).

In considering claims 7 and 8, although Venkatraman and Handley show substantial features of the claimed invention, they fail to disclose a method wherein the computer software code comprises one or more Java mobile agents. However, Lavian et al., whose invention is a method and apparatus for automatically configuring a network switch having external network

Art Unit: 2153

data ports, a processor, and memory, discloses such a computer software code comprising one or more Java mobile agents (see col. 6, lines 31-41). Therefore, given the teachings of Lavian et al., it would have been obvious for a person having ordinary skills in the art to modify Venkatraman et al. and Handley et al. by providing computer software code that comprises one or more Java mobile agents in order to provide compatibility with various Java-based environments, including mobile/wireless environments.

Response to Arguments

7. Applicant's arguments with respect to claims 1-33 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kimberly D Flynn whose telephone number is 703-308-7609. The examiner can normally be reached on M-F 8:30 - 5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Glen Burgess can be reached on 703-305-4792. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
